Site 1: EcoRV (destroyed); Site 2: Not!; RNA source pool
Site 1: EcoRV (destroyed); Site 2: Not!; RNA source pool
Of three ovaries, from females ranging in age from 38 to
49 yo. Library is oligo-dT prined and directionally cloned
(EcoRV site is destroyed upon cloning). Average insert
size 2.1 kb, insert size range 1-3:5 kb. Library is normalized and enriched for full-length clones and was
constructed by C. Gruber (Invitrogen). Research Genetics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                     The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating insulin-like growth factor-1 (IGF-1) receptor are useful for treating insulin-like growth factor (IGF) sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful in screening for compounds that bind to IR or IGF-1 receptor, potential therapeutics and research reagents. ABK47246-ABK47277 represent IR and/or IGF-1 receptor DNA sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin angonist are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating insulin-like growth factor-1 (IGF)-sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful is screening for compounds that bind to IR or IGF-1 receptor, potential therapeutics and research reagents. ABRA1246-ABKA1277 represent IR and/or IGF-1 receptor IR

                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of modulating insulin activity in receptor (IR). A composition containing a peptide, optionally expressed agonist are useful for treating diabetes. Also, peptides that are antagonist are useful for treating diabetes. Also, peptides that are antagonists of the insulin-like growth factor-1 (IGF) receptor are useful for treating insulin-like growth factor (IGF)-sensitive tumours (e.g. & prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful in screening for compounds that bind to IR or IGF-1 receptor, potential therapeutiqs and research reagents. ABK47246-ABK47277 represent IR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CGGTTCAGTGGCAGTGGATCTGGGACAGATTTCACTCTCACCATCAGCAGCCTACAGCCT 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         297
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                     factor alpha (TNF-alpha) antibody (Ab) light chain variable region. The Ab dissociates from TNF-alpha with a Kd of LX10 power -8 M or less and has a Koff rate constant of LX10 power -3 s power -1 or less (both determined by surface plasmon resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro L929 assay with an ICSO of LX10 power -7 M or less. The Ab, which inhibits TNF-alpha ctivity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple sclerosis, autoimmune diseases, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, alcoholic, viral or fulminant hepatitis, coadulation disease, alcoholic, viral or fulminant hepatitis, coadulation disease, alcoholic, viral or fulminant hepatitis, coadulation disease, alcoholic, viral or fulminant hepatitis, coadulation disease, alcoholic, viral or fulminant hepatitis, oscar tissue formation, pyrexia, periodontal disease, obesity and radiation toxicity. The Ab also inhibits TNF-alpha induced expression of endothelial call lelboyte adhesion molecule-1 (ELAM-1) on human umbilical vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 Arcacrigregegeaagreagegearcagaaarracriagecrigerarcageaaaacca

The Cgamma DNA is useful for creating a humanised Ig locus and making transgenic animals capable of producing humanised Ig molecules. The present sequence is a recombination vector of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel humanised antibodies useful for treating diseases caused t

The invention provides a neuromodulatory agent (I) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CNS). (I) is capable of inducing remyelination, promoting cellular proliferation of glial cells, and promoting Ca2+ signaling with oligodendrocytes. An humanised antibody to (I) can be selected from antibody sHIGMSZ (LMW 22), ebvHigh Ms119B10, ebv High CG2B68, AKMF4, CB31B12, CB21E7 or MS119E5. (I) is useful for stimulating crawyelination of CNS axons, or treating demyelinating proliferation of glial cells in CNS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is preferably useful for treating a demyelinating disease of CNS. (I) is preferably useful for treating a demyelinating disease of CNS. (TMEV) or for treating a human being having multiple sclerosis, or a chuman or domestic animal with a viral demyelinating disease of CNS. (I) is also useful for simulating remyelination of CNS axons. The autibodies are useful for stimulating infection by a bacterium, virus or like pathogen that causes demyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a patient are useful for treating multiple sclerosis, parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes a human anti-tumour antigen monoclonal antibody (MAD) light chain variable region, useful medicine, pharmacology and biochemistry. The isotype of a MAD secreted by the human/human hybridoma HT was determined to be and kappa. Human MAD was purified, and the antigen recognised human MAD was purified, and the antigen recognised human MAD cLN*_ISM identified by western blocting.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunoglobulin superfamily proteins, the agonist and antagonist of the protein is useful for preventing and treating disorders associated with altered levels of the protein such as cancer, immune system disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the human immunoglobulin superfamily protein IGFAM.10 gene, which was isolated from a cDNA library of colon tissue. It is expressed in reproductive, gastrointestinal and cardiovascular tissue, where cancer and inflammation are common. The gene, protein, its antibodies, agonists and antagonists are suitable fo diagnosing and treating many disease; including cancer, immune system arteriosclerosis, ashima, alberosclerosis, cholecystifis, croh's disease, diabetes mellitus, emphysema, Graves' disease, hepatitis, multiple sclerosis, psoriașis, iheumatoid arthritis, scleroderma, systemate, lupus arythematosus and ulcerative oolitis), complications of cancer, hammatogia and extracorporeal circulation, trauma and haematopoiețic cancer (such as leukaemia) and infections caused by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertorie of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded diagnostic, prophylactic and therapeutic procedures. The present sequence encodes the single chain antibody (ScFv) that forms the basis of a library according to the invention.

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, dermatological, immunosuppressive, thyromimetic, antinterutility, neuroprotective, antinifertility, neuroprotective, antinifertility, neuroprotective, antinifertility, neuroprotective, antinifertility, neuroprotective, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic disease sythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndcoern, Goodpasture syndrome, Crom's anemia, Addison's disease, thrombopenia purpura, insulin multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arreriosolerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively chinibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in mrine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents can human immunoslobulin light chain kappa variable region subgroup type I which is used in the construction of humanised anti-Fas antibody constructs described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 132

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GGGAAAĞCCCCTAAĞCTCCTGATCTATGCTGCATCCAGTTTGCAAAGTGGGGTCCCATCA 252
                                                                                                                                                                                                                                                             The invention relates to a preventive or treating agent for diseases caused by a bnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of induring appropriation a cell expressing Fas. The agent has immunosuppressive and antiallersy activity and is used for preventing and treating autoimmune pCR primer, useful to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
